rite a Python program that converts a distance in kilometers to miles and vice versa (1 kilometer = 0.621371 miles). Ask the user for the direction of conversion (kilometers to miles or miles to kilometers), and print the result.

- **Write a Python program that accepts two integer values from the user and calculates their greatest common divisor (GCD) using the Euclidean algorithm. Then, check if both numbers are divisible by their GCD using a comparison operator.**
- **Write a Python program that calculates the perimeter and area of a circle. Take the radius as input from the user. Then, use comparison operators to check if the perimeter is greater than the area and print the result.**
- **Write a Python program that checks if a number entered by the user is a prime number. Use a for loop and a logical operator to check divisibility. If the number is prime, print "Prime", otherwise print "Not Prime".**
- **Write a Python program that calculates the sum and product of digits of a given number. For example, if the number is 123, the sum will be 1 + 2 + 3, and the product will be 1 * 2 * 3. Print the sum and product of the digits.**
- **Write a Python program that takes a number as input and checks whether it is a perfect number. A perfect number is a positive integer that is equal to the sum of its proper divisors (excluding the number itself). For example, 6 is a perfect number because 1 + 2 + 3 = 6.**
- **Write a program that takes the radius of a circle as input and calculates and prints the area and circum ference.**
- **Write a Python program that accepts an integer (n) and computes the value of n+nn+nnn.**
- **Write a Python program that asks the user for their name and birth year, calculates their age based on the current year (2025), and prints a message greeting them with their age in one line.**
- **Write a program to take three names as input from the user in a single call to the input() func tion.(Hints:Use split() after input())**
- **Write a Python program that takes four integers as input from the user and**
